

Basics of Strings in Python

L555
Dept. of Linguistics, Indiana University
Fall 2010

Interactive Programs

- ▶ Strings can have placeholders, the values can follow:

```
print 'Hi_%s' % 'Markus'
```

Interactive Programs

- ▶ Strings can have placeholders, the values can follow:

```
print 'Hi_%s' % 'Markus'
```

- ▶ and we can do that with variables, too

```
greeting = 'Hi_%s'  
name = 'Markus'  
print greeting % name
```

Interactive Programs

- ▶ Strings can have placeholders, the values can follow:

```
print 'Hi_%s' % 'Markus'
```

- ▶ and we can do that with variables, too

```
greeting = 'Hi_%s'  
name = 'Markus'  
print greeting % name
```

- ▶ and with more than one value

```
greeting = 'Hi_%s, what_a_%s_day_today, it\'s  
%i_degrees_outside.'  
vals = ('Markus', 'cold', 36)  
print greeting % vals
```

Interactive Programs

- ▶ Strings can have placeholders, the values can follow:

```
print 'Hi_%s' % 'Markus'
```

- ▶ and we can do that with variables, too

```
greeting = 'Hi_%s'  
name = 'Markus'  
print greeting % name
```

- ▶ and with more than one value

```
greeting = 'Hi_%s, what_a_%s_day_today, it\'s  
%i_degrees_outside.'  
vals = ('Markus', 'cold', 36)  
print greeting % vals
```

- ▶ Make sure to use a tuple, not a list, for the values!

Conversion Types

d,i signed integer decimal
u unsigned integer
f,F floating point decimal
c single character
r string (converted with repr)
s string (converted with str)

Width, Precision, and Zeroes

- ▶ in displaying a number, we define the width and precision:

```
from math import pi
print 'Pi:_%10.3f' % pi
```

 - Strip
 - Translate

Width, Precision, and Zeroes

- ▶ in displaying a number, we define the width and precision:

```
from math import pi
print 'Pi:_%10.3f' % pi
```

- ▶ and we can fill the whole thing with zeroes

```
from math import pi
print 'Pi:_%010.3f' % pi
```

- ▶ a - creates left alignment, a + adds the plus sign to the number

```
from math import pi
print 'Pi:_%-10.3f' % pi
```

String and Tuples

Example

You can format tuples all at once, e.g.
'%s: %4.2f' % ('pi', pi)

- Basics of Strings in Python
- String basics
- Conversion Types
- Number Formatting
- Tuples
- String Methods
 - find
 - Join / Split
 - Lower Case
 - Replace
 - Strip
 - Translate

find

Example

1. Find where *in* starts in the phrase *needle in a haystack*
phrase='needle in a haystack'
phrase.find('in')

- Basics of Strings in Python
- String basics
- Conversion Types
- Number Formatting
- Tuples
- String Methods
 - find
 - Join / Split
 - Lower Case
 - Replace
 - Strip
 - Translate

find

Example

1. Find where *in* starts in the phrase *needle in a haystack*
phrase='needle in a haystack'
phrase.find('in')
2. If *needle in a haystack* contains *hay*, print *hey*
if phrase.find('hay')>=0:
print('hey')

- Basics of Strings in Python
- String basics
- Conversion Types
- Number Formatting
- Tuples
- String Methods
 - find
 - Join / Split
 - Lower Case
 - Replace
 - Strip
 - Translate

find

Example

1. Find where *in* starts in the phrase *needle in a haystack*
phrase='needle in a haystack'
phrase.find('in')
 2. If *needle in a haystack* contains *hay*, print *hey*
if phrase.find('hay')>=0:
print('hey')
- ▶ find does NOT return a Boolean value: if it does not find the substring, it returns -1

- Basics of Strings in Python

- Conversion Types
- Number Formatting
- Tuples
- String Methods
 - find
 - Join / Split
 - Lower Case
 - Replace
 - Strip
 - Translate

Join and Split

- 1. Split the haystack phrase into multiple words
`words=phrase.split()`

- Basics of Strings in Python
- String basics
- Conversion Types
- Number Formatting
- Tuples
- String Methods
- find
- Join / Split
- Lower Case
- Replace
- Strip
- Translate

Join and Split

- 1. Split the haystack phrase into multiple words
`words=phrase.split()`
- 2. Reverse the order of the words
`words.reverse()`

- Basics of Strings in Python
- String basics
- Conversion Types
- Number Formatting
- Tuples
- String Methods
- find
- Join / Split
- Lower Case
- Replace
- Strip
- Translate

Join and Split

- 1. Split the haystack phrase into multiple words
`words=phrase.split()`
- 2. Reverse the order of the words
`words.reverse()`
- 3. Join the words back together with commas
`','.join(words)`

- Basics of Strings in Python
- String basics
- Conversion Types
- Number Formatting

- String Methods
- find
- Join / Split
- Lower Case
- Replace
- Strip
- Translate

Changing Case

- 1. Make ALLCAPS all lowercase
`'ALLCAPS'.lower()`

- Basics of Strings in Python
- String basics
- Conversion Types
- Number Formatting
- Tuples
- String Methods
- find
- Join / Split
- Lower Case
- Replace
- Strip
- Translate

Changing Case

- 1. Make ALLCAPS all lowercase
`'ALLCAPS'.lower()`
- 2. Make all but the first letter of ALLCAPS lowercase
`'ALLCAPS'.title()`

- Basics of Strings in Python
- String basics
- Conversion Types
- Number Formatting
- Tuples
- String Methods
- find
- Join / Split
- Lower Case
- Replace
- Strip
- Translate

Replace

- 1. Replace *needle* with *noodle* in the haystack phrase
`phrase.replace('needle', 'noodle')`

- Basics of Strings in Python
- String basics
- Conversion Types
- Number Formatting
- Tuples
- String Methods
- find
- Join / Split
- Lower Case
- Replace
- Strip
- Translate

Replace

1. Replace *needle* with *noodle* in the haystack phrase `phrase.replace('needle', 'noodle')`
2. Replace *e* with *o* in the haystack phrase `phrase=phrase.replace('e', 'o')`

- Basics of Strings in Python
- String basics
 - Conversion Types
 - Number Formatting
 - Tuples
- String Methods
 - find
 - Join / Split
 - Lower Case
 - Replace
 - Strip
 - Translate

Strip

1. Strip off newline characters from end of the haystack phrase `phrase=phrase.strip('\r\n')`

- Basics of Strings in Python
- String basics
 - Conversion Types
 - Number Formatting
 - Tuples
- String Methods
 - find
 - Join / Split
 - Lower Case
 - Replace
 - Strip
 - Translate

Strip

1. Strip off newline characters from end of the haystack phrase `phrase=phrase.strip('\r\n')`
2. Strip off any leading or trailing whitespace from the haystack phrase, and convert to upper case `phrase=phrase.strip().upper()`

- Basics of Strings in Python

Translate

Definition

Translate can be used to map an entire character set to a different one, using a one-to-one mapping.

Example

I accidentally switch my keyboard to German mode, in which *y* and *z* are switched, and type my entire thesis this way without noticing.

```
thesis='verbositz ün überbaliying üis üuglz'
from string import maketrans
germanToEnglish=maketrans('yz','zy')
thesis.translate(germanToEnglish)
```
