# Parsing with CFGs

L445 / L545

Dept. of Linguistics, Indiana University  
Spring 2017

---

# Parsing with CFGs: Overview

**Input:** a string

**Output:** a (single) parse tree

- ▶ A useful step in the process of obtaining meaning
- ▶ We can view the problem as searching through all possible parses (tree structures) to find the right one

Strategies:

- ▶ top-down (goal-directed) vs. bottom-up (data-directed)
- ▶ depth-first vs. breadth-first
- ▶ left-corner parsing (adding bottom-up to top-down)
- ▶ chart parsing (saving partial results)

Direction of processing

Top-down

Bottom-up

Left-corner parsing

Chart parsing

CYK

Earley

# Parsers and criteria to evaluate them

- ▶ Function of a parser:
  - ▶ grammar + string  $\rightarrow$  analysis trees
- ▶ Main criteria for evaluating parsers:
  - ▶ Correctness: for every grammar and for every string, every analysis returned by parser is an actual analysis
    - ▶ Correctness w.r.t. our target language is thus dependent upon the grammar we give the parser
  - ▶ Completeness: for every grammar and for every string, every correct analysis is found by the parser
    - ▶ For large grammars, this may not be practical, and for some situations, we may want only one analysis
  - ▶ Efficiency: storing partial parses is essential in being efficient (to be explained)

# Example grammar and desired tree

**Sentence:** Book that flight.

- ▶  $S \rightarrow NP VP$
- ▶  $S \rightarrow Aux NP VP$
- ▶  $S \rightarrow VP$
- ▶  $NP \rightarrow Det Nominal$
- ▶  $Nominal \rightarrow Noun$
- ▶  $Nominal \rightarrow Noun$   
Nominal
- ▶  $Nominal \rightarrow Nominal PP$
- ▶  $NP \rightarrow Proper-Noun$
- ▶  $VP \rightarrow Verb$
- ▶  $VP \rightarrow Verb NP$

Direction of  
processing

Top-down

Bottom-up

Left-corner parsing

Chart parsing

CYK

Earley

# Direction of processing I

## Top-down

**Goal-driven** processing is top-down:

- ▶ Start with the start symbol
- ▶ Derive sentential forms
  - ▶ If the string is among the sentences derived this way, it is part of the language

Problem: Left-recursive rules (e.g.,  $NP \rightarrow NP PP$ ) can give rise to infinite hypotheses

- ▶ Plus, we can expand non-terminals which cannot lead to the existing input
- ▶ No tree takes the properties of the lexical items into account until the last stage

Direction of processing

Top-down

Bottom-up

Left-corner parsing

Chart parsing

CYK

Earley

# How are alternatives explored?

## I. Depth-first

At every choice point: Pursue a single alternative completely before trying another alternative

- ▶ State of affairs at the choice points needs to be remembered. Choices can be discarded after unsuccessful exploration.
- ▶ Depth-first search is not necessarily complete.

Problem for top-down, left-to-right, depth-first processing:

- ▶ left-recursion  
For example, a rule like  $N' \rightarrow N' PP$  leads to non-termination.

Direction of processing

Top-down

Bottom-up

Left-corner parsing

Chart parsing

CYK

Earley

# How are alternatives explored?

## II. Breadth-first

At every choice point: Pursue every alternative for one step at a time

- ▶ Requires serious bookkeeping since each alternative computation needs to be remembered at the same time.
- ▶ Search is guaranteed to be complete.

# An example grammar

## Lexicon:

Vt  $\rightarrow$  *saw*

Det  $\rightarrow$  *the*

Det  $\rightarrow$  *a*

N  $\rightarrow$  *dragon*

N  $\rightarrow$  *boy*

Adj  $\rightarrow$  *young*

## Syntactic rules:

S  $\rightarrow$  NP VP

VP  $\rightarrow$  Vt NP

NP  $\rightarrow$  Det N

N  $\rightarrow$  Adj N

# Top-down, left-right, depth-first tree traversal

S → NP VP

VP → Vt NP

NP → Det N

N → Adj N

Vt → saw

Det → the

Det → a

N → dragon

N → boy

Adj → young

# A walk-through

Goal	Input	Action
S	the young boy saw the dragon	expand S
NP VP	the young boy saw the dragon	expand NP
Det N VP	the young boy saw the dragon	expand Det
the N VP	the young boy saw the dragon	consume <i>the</i>
N VP	young boy saw the dragon	expand N
dragon VP	young boy saw the dragon	fail with <i>dragon</i>
boy VP	young boy saw the dragon	fail with <i>boy</i> ; (re)expand N
Adj N VP	young boy saw the dragon	expand Adj
young N VP	young boy saw the dragon	consume <i>young</i>
N VP	boy saw the dragon	expand N

# A walk-through (cont.)

Goal	Input	Action
dragon VP	boy saw the dragon	fail with <i>dragon</i>
boy VP	boy saw the dragon	consume <i>boy</i>
VP	saw the dragon	expand VP
Vt NP	saw the dragon	expand Vt
saw NP	saw the dragon	consume <i>saw</i>
NP	the dragon	expand NP
Det N	the dragon	expand Det
the N	the dragon	consume <i>the</i>
N	dragon	expand N
dragon	dragon	consume <i>dragon</i>
<empty>	<empty>	SUCCESS!

There are still some choices that have to be made:

1. Which leaf node should be expanded first?
  - ▶ Left-to-right strategy moves through the leaf nodes in a left-to-right fashion
2. Which rule should be applied first for multiple rules with same LHS?
  - ▶ Can just use the textual order of rules from the grammar
  - ▶ There may be reasons to take rules in a particular order (e.g., probabilities)

# Parsing with an agenda

Search states are kept in an agenda

- ▶ Search states consist of partial trees and a pointer to the next input word in the sentence

Based on what we've seen before, apply the next item on the agenda to the current tree

- ▶ Add new items to the agenda, based on the rules in the grammar which can expand at the (leftmost) node
  - ▶ We maintain the depth-first strategy by adding new hypotheses (rules) to the front of the agenda
  - ▶ If we added them to the back, we would have a breadth-first strategy

# Direction of processing II

## Bottom-up

**Data-driven** processing is bottom-up:

- ▶ Start with the sentence.
- ▶ For each substring, find a grammar rule which covers it.
- ▶ If you finish with a sentence, it is grammatical.

Problem: Epsilon rules ( $N \rightarrow \epsilon$ ) allow us to hypothesize empty categories anywhere in the sentence.

- ▶ Also, while any parse in progress is tied to the input, many may not lead to an S!

# Bottom-up, left-right, depth-first tree traversal

S → NP VP

VP → Vt NP

NP → Det N

N → Adj N

Vt → saw

Det → the

Det → a

N → dragon

N → boy

Adj → young

# A walk-through

Analysis	Input	Action
<empty>	the young boy saw the dragon	shift <i>the</i>
the	young boy saw the dragon	reduce <i>the</i> to Det
Det	young boy saw the dragon	shift <i>young</i> after failing to reduce Det
Det young	boy saw the dragon	reduce <i>young</i> to Adj after failing to reduce Det <i>young</i>

NP Vt NP	<empty>	reduce Vt NP to VP
NP VP	<empty>	reduce NP VP to S
S	<empty>	SUCCESS!

# Left-corner parsing

Direction of processing

Top-down

Bottom-up

Left-corner parsing

Chart parsing

CYK

Earley

Motivation:

- ▶ Both pure top-down & bottom-up approaches are inefficient
- ▶ The correct top-down parse has to be consistent with the left-most word of the input

**Left-corner parsing:** a way of using bottom-up constraints as part of a top-down strategy.

- ▶ Left-corner rule:
  - ▶ Expand a node with a grammar rule only if the current input can serve as the left corner from this rule
- ▶ Left-corner from a rule: first word along the left edge of a derivation from the rule

Put the left-corners into a table, which then guide parsing

# Grammar with left-corners

## Lexicon:

Vt  $\rightarrow$  *saw*

Det  $\rightarrow$  *the*

Det  $\rightarrow$  *a*

N  $\rightarrow$  *dragon*

N  $\rightarrow$  *boy*

Adj  $\rightarrow$  *young*

## Syntactic rules:

S  $\rightarrow$  NP VP

VP  $\rightarrow$  Vt NP

NP  $\rightarrow$  Det N

N  $\rightarrow$  Adj N

## Left corners:

S  $\Rightarrow$  Det

VP  $\Rightarrow$  Vt

NP  $\Rightarrow$  Det

N  $\Rightarrow$  Adj

# Left corner parsing example

Consider again *book that flight*, with these rules:

$S \rightarrow NP VP$	Nom. $\rightarrow$ Noun	$VP \rightarrow$ Verb
$S \rightarrow Aux NP VP$	Nom. $\rightarrow$ Noun Nom.	$VP \rightarrow$ Verb NP
$S \rightarrow VP$	Nom. $\rightarrow$ Nom. PP	
$NP \rightarrow Det Nom.$	$NP \rightarrow$ Proper-Noun	

With an ambiguous word like *book*, left corners tell us the Noun reading is ruled out—it cannot start an S

$S \Rightarrow Aux$	$S \Rightarrow Verb$	$VP \Rightarrow Verb$
$S \Rightarrow Det$	$NP \Rightarrow Det$	
$S \Rightarrow PropN$	$NP \Rightarrow PropN$	

Moving top-down, we hypothesize  $S \rightarrow NP VP$ , but the NP's left-corner is incompatible with any category of *book*

- ▶ Thus, no NP expansions are considered

Direction of processing

Top-down  
Bottom-up

Earley

# Chart parsing

Problem: Inefficiency of recomputing subresults

Two example sentences and their potential analysis:

- (1) He [gave [the young cat] [to Bill]].
- (2) He [gave [the young cat] [some milk]].

The corresponding grammar rules:

- ▶  $VP \rightarrow V_{ditrans} NP PP_{to}$
- ▶  $VP \rightarrow V_{ditrans} NP NP$

Regardless of final sentence analysis, the object NP (*the young cat*) will have the same analysis

⇒ No need to analyze it twice

Direction of processing

Top-down

Bottom-up

Left-corner parsing

Chart parsing

CYK

Earley

# Solution: Chart Parsing (Memoization)

- ▶ Store intermediate results:
  - a) completely analyzed constituents:  
**well-formed substring table** or **(passive) chart**
  - b) partial and complete analyses:  
**(active) chart**
- ▶ In other words, instead of recalculating that *the young cat* is an NP, we'll store that information
  - ▶ Dynamic programming: never go backwards
- ▶ All intermediate results need to be stored for completeness.
- ▶ All possible solutions are explored in parallel.

# Cocke Younger Kasami (CYK) Algorithm

- ▶ Grammar has to be in Chomsky Normal Form (CNF):
  - ▶ RHS with a single terminal:  $A \rightarrow a$
  - ▶ RHS with two non-terminals:  $A \rightarrow BC$
  - ▶ no  $\epsilon$  rules ( $A \rightarrow \epsilon$ )
- ▶ A representation of the string showing positions and word indices:

$\cdot_0$   $w_1$   $\cdot_1$   $w_2$   $\cdot_2$   $w_3$   $\cdot_3$   $w_4$   $\cdot_4$   $w_5$   $\cdot_5$   $w_6$   $\cdot_6$

For example:

$\cdot_0$  the  $\cdot_1$  young  $\cdot_2$  boy  $\cdot_3$  saw  $\cdot_4$  the  $\cdot_5$  dragon  $\cdot_6$

# Well-formed substring table (passive chart)

- ▶ The well-formed substring table, henceforth (passive) chart, for a string of length  $n$  is an  $n \times n$  matrix.
- ▶ The field  $(i, j)$  of the chart encodes the set of all categories of constituents that start at position  $i$  and end at position  $j$ , i.e.
  - ▶  $\text{chart}(i, j) = \{A \mid A \Rightarrow^* w_{i+1} \dots w_j\}$
- ▶ The matrix is triangular since no constituent ends before it starts.

# Coverage Represented in the Chart

An input sentence with 6 words:

$\cdot_0 W_1 \cdot_1 W_2 \cdot_2 W_3 \cdot_3 W_4 \cdot_4 W_5 \cdot_5 W_6 \cdot_6$

Coverage represented in the chart:

		TO:					
		1	2	3	4	5	6
FROM:	0	0-1	0-2	0-3	0-4	0-5	0-6
	1		1-2	1-3	1-4	1-5	1-6
	2			2-3	2-4	2-5	2-6
	3				3-4	3-5	3-6
	4					4-5	4-6
	5						5-6

# Example for Coverage Represented in Chart

Example sentence:

·<sub>0</sub> the ·<sub>1</sub> young ·<sub>2</sub> boy ·<sub>3</sub> saw ·<sub>4</sub> the ·<sub>5</sub> dragon ·<sub>6</sub>

Coverage represented in chart:

	1	2	3	4	5	6
0	the	the young	the young boy	the young boy saw	the young boy saw the	the young boy saw the dragon
1		young	young boy	young boy saw	young boy saw the	young boy saw the dragon
2			boy	boy saw	boy saw the	boy saw the dragon
3				saw	saw the	saw the dragon
4					the	the dragon
5						dragon

# Parsing with a Passive Chart

- ▶ The CKY algorithm is used, which:
  - ▶ explores all analyses in parallel,
  - ▶ in a bottom-up fashion, &
  - ▶ stores complete subresults
- ▶ This algorithm is used to:
  - ▶ add top-down guidance (only use rules derivable from start-symbol), but avoid left-recursion problem
  - ▶ store partial analyses

# An Example for a Filled-in Chart

## Input sentence:

·<sub>0</sub> the ·<sub>1</sub> young ·<sub>2</sub> boy ·<sub>3</sub> saw ·<sub>4</sub> the ·<sub>5</sub> dragon ·<sub>6</sub>

## Chart:

	1	2	3	4	5	6
0	{Det}	{}	{NP}	{}	{}	{S}
1		{Adj}	{N}	{}	{}	{}
2			{N}	{}	{}	{}
3				{V, N}	{}	{VP}
4					{Det}	{NP}
5						{N}

# Filling in the Chart

- ▶ We build all constituents that end at a certain point before we build constituents that end at a later point.

	1	2	3	4	5	6

5						<b>16</b>

```

for  $j := 1$  to length(string)
  lexical_chart_fill( $j - 1, j$ )
  for  $i := j - 2$  down to 0
    syntactic_chart_fill( $i, j$ )
  
```

## lexical\_chart\_fill( $j-1, j$ )

- ▶ Idea: Lexical lookup. Fill the field  $(j - 1, j)$  in the chart with the preterminal category dominating word  $j$ .
- ▶ Realized as:

$$\text{chart}(j - 1, j) := \{X \mid X \rightarrow \text{word}_j \in P\}$$

# syntactic\_chart\_fill(i,j)

- ▶ Idea: Perform all reduction steps using syntactic rules s.t. the reduced symbol covers the string from  $i$  to  $j$ .

- ▶ Realized as: 
$$\text{chart}(i,j) = \left\{ A \mid \begin{array}{l} A \rightarrow BC \in P, \\ i < k < j, \\ B \in \text{chart}(i,k), \\ C \in \text{chart}(k,j) \end{array} \right\}$$

- ▶ Explicit loops over every possible value of  $k$  and every context free rule:

$\text{chart}(i,j) := \{\}$ .

for  $k := i + 1$  to  $j - 1$

for every  $A \rightarrow BC \in P$

if  $B \in \text{chart}(i,k)$  and  $C \in \text{chart}(k,j)$  then

$\text{chart}(i,j) := \text{chart}(i,j) \cup \{A\}$ .

# The Complete CYK Algorithm

Input: start category  $S$  and input *string*

$n := \text{length}(\text{string})$

for  $j := 1$  to  $n$

$\text{chart}(j-1, j) := \{X \mid X \rightarrow \text{word}_j \in P\}$

    for  $i := j-2$  down to  $0$

$\text{chart}(i, j) := \{\}$

        for  $k := i+1$  to  $j-1$

            for every  $A \rightarrow BC \in P$

                if  $B \in \text{chart}(i, k)$  and  $C \in \text{chart}(k, j)$  then

$\text{chart}(i, j) := \text{chart}(i, j) \cup \{A\}$

Output: if  $S \in \text{chart}(0, n)$  then accept; else reject

# How memoization helps

If we look back to the chart for the sentence *the young boy saw the dragon*:

	1	2	3	4	5	6
0	{Det}	{}	{NP}	{}	{}	{S}
1		{Adj}	{N}	{}	{}	{}
2			{N}	{}	{}	{}
3				{V, N}	{}	{VP}
4					{Det}	{NP}
5						{N}

- ▶ At cell (3,6), a VP is built by combining the V at (3,4) with the NP at (4,6), based on the rule  $VP \rightarrow V NP$
- ▶ Regardless of further processing, that VP is never rebuilt

Direction of processing

Top-down

Bottom-up

Left-corner parsing

Chart parsing

CYK

Earley

# From CYK to Earley

- ▶ CKY algorithm:
  - ▶ explores all analyses in parallel
  - ▶ is bottom-up
  - ▶ stores complete subresults
- ▶ desiderata:
  - ▶ add top-down guidance (to only use rules derivable from start-symbol), but avoid left-recursion problem of top-down parsing
  - ▶ store partial analyses (useful for rules right-hand sides longer than 2)
- ▶ Idea: also store partial results, so that the chart contains
  - ▶ passive items: complete results
  - ▶ active items: partial results

# Representing active chart items

- ▶ well-formed substring entry:  
 $\text{chart}(i, j, A)$ : from  $i$  to  $j$  there is a constituent of category  $A$
- ▶ More elaborate data structure needed to store partial results:
  - ▶ rule considered + how far processing has succeeded
  - ▶ dotted rule:  
$$i[A \rightarrow \alpha \bullet_j \beta]$$
- ▶ active chart entry:  
 $\text{chart}(i, j, \text{state}(A, \beta))$  Note:  $\alpha$  is not represented  
 $A$  (incompletely) goes from  $i$  to  $j$  and can be completed by finding  $\beta$

# Dotted rule examples

- ▶ A dotted rule represents a state in processing a rule.
- ▶ Each dotted rule is a hypothesis:

	We found a <i>vp</i> if we still find
$vp \rightarrow \bullet v\text{-ditr } np \ pp\text{-to}$	a <i>v-ditr</i> , a <i>np</i> , and a <i>pp-to</i>
$vp \rightarrow v\text{-ditr } \bullet np \ pp\text{-to}$	a <i>np</i> and a <i>pp-to</i>
$vp \rightarrow v\text{-ditr } np \ \bullet pp\text{-to}$	a <i>pp-to</i>
$vp \rightarrow v\text{-ditr } np \ pp\text{-to } \bullet$	nothing

- ▶ The first three are **active items** (or **active edges**)
- ▶ The last one is a **passive item/edge**

# The three actions in Earley's algorithm

In  $_i[A \rightarrow \alpha \bullet_j B\beta]$  we call  $B$  the *active constituent*.

- ▶ **Prediction:** Search all rules realizing the active constituent.
- ▶ **Scanning:** Scan over each word in the input string.
- ▶ **Completion:** Combine an active edge with each passive edge covering its active constituent.

**Success state:**  $_0[start \rightarrow s \bullet_n]$

# A closer look at the three actions

## Prediction

**Prediction:** for each  $i[A \rightarrow \alpha \bullet_j B \beta]$  in chart  
 for each  $B \rightarrow \gamma$  in rules  
 add  $j[B \rightarrow \bullet \gamma]$  to chart

Prediction is the task of saying what kinds of input we expect to see

- ▶ Add a rule to the chart saying that we have not seen  $\gamma$ , but when we do, it will form a B
- ▶ The rule covers no input, so it goes from  $j$  to  $j$

Such rules provide the top-down aspect of the algorithm

Direction of processing

Top-down

Bottom-up

Left-corner parsing

Chart parsing

CYK

Earley

# A closer look at the three actions

## Scanning

**Scanning:** let  $w_1 \dots w_j \dots w_n$  be the input string  
 for each  $i[A \rightarrow \alpha \bullet_{j-1} w_j \beta]$  in chart  
 add  $i[A \rightarrow \alpha w_j \bullet_j \beta]$  to chart

Scanning reads in lexical items

- ▶ We add a dotted rule indicating that a word has been seen between  $j - 1$  and  $j$
- ▶ Such a completed dotted rule can be used to complete other dotted rules

These rules provide the bottom-up component to the algorithm

Direction of processing

Top-down

Bottom-up

Left-corner parsing

Chart parsing

CYK

Earley

# A closer look at the three actions

## Completion

### Completion (fundamental rule of chart parsing):

for each  $_i[A \rightarrow \alpha \bullet_k B \beta]$  and  $_k[B \rightarrow \gamma \bullet_j]$  in chart  
 add  $_i[A \rightarrow \alpha B \bullet_j \beta]$  to chart

Completion combines two rules in order to move the dot, i.e., indicate that something has been seen

- ▶ A rule covering B has been seen, so any rule A which refers to B in its RHS moves the dot
- ▶ Instead of spanning from  $i$  to  $k$ , A now spans from  $i$  to  $j$ , which is where B ended

Once the dot is moved, the rule will not be created again

Direction of processing

Top-down

Bottom-up

Left-corner parsing

Chart parsing

CYK

Earley

# Eliminating scanning

**Scanning:** for each  $i[A \rightarrow \alpha \bullet_{j-1} w_j \beta]$  in chart  
 add  $i[A \rightarrow \alpha w_j \bullet_j \beta]$  to chart

**Completion:**

for each  $i[A \rightarrow \alpha \bullet_k B \beta]$  and  $k[B \rightarrow \gamma \bullet_j ]$  in chart  
 add  $i[A \rightarrow \alpha B \bullet_j \beta]$  to chart

**Observation:** Scanning = completion + words as passive edges. One can thus simplify scanning to adding a passive edge for each word:

for each  $w_j$  in  $w_1 \dots w_n$   
 add  $j-1[w_j \rightarrow \bullet_j]$  to chart

Direction of  
processing

Top-down

Bottom-up

18.  $_0[\text{start} \rightarrow \text{s} \bullet_3]$

# Improving the efficiency of lexical access

- ▶ In the setup just described:
  - ▶ Words are stored as passive items so that prediction is used for preterminal categories
  - ▶ Set of predicted words for a preterminal can be huge
- ▶ If each word in the grammar is introduced by a preterminal rule  $cat \rightarrow word$ , one can add a **passive item for each preterminal category** which can dominate the word instead of for the word itself
- ▶ What needs to be done:
  - ▶ syntactically distinguish syntactic rules from rules with preterminals on the left-hand side, i.e. lexical entries.
  - ▶ modify scanning to take lexical entries into account

# Earley parsing

The Earley algorithm is efficient, running in polynomial time.

- ▶ Technically, however, it is a recognizer, not a parser

To make it a parser, each state needs to be augmented with a pointer to the states that its rule covers

- ▶ For example, VP points to state where V was completed and state where NP was completed
- ▶ Also true of the CKY algorithm: pointers need to be added to make it a parser
