

# Dependency Parsing

L445 / L545

With thanks to Joakim Nivre and Sandra Kübler

# Dependency Syntax

- ▶ Basic idea:
  - ▶ Syntactic structure consists of **lexical items**, linked by binary asymmetric relations called **dependencies**.
- ▶ In the (translated) words of Lucien Tesnière [Tesnière(1959)]:
  - ▶ The sentence is an *organized whole*, the constituent elements of which are *words*. [1.2] Every word that belongs to a sentence ceases by itself to be isolated as in the dictionary. Between the word and its neighbors, the mind perceives *connections*, the totality of which forms the structure of the sentence. [1.3] The structural connections establish *dependency* relations between the words. Each connection in principle unites a *superior* term and an *inferior* term. [2.1] The superior term receives the name *governor*. The inferior term receives the name *subordinate*. Thus, in the sentence *Alfred parle* [. . .], *parle* is the governor and *Alfred* the subordinate. [2.2]

# Overview: constituency

(1) Small birds sing loud songs

## Overview: dependency

The corresponding dependency tree representations [Hudson(2000)]:

# Dependency Structure

Economic news had little effect on financial markets .

# Dependency Structure

Economic news had little effect on financial markets .

The diagram illustrates a dependency structure for the sentence "Economic news had little effect on financial markets .". A dependency arc is drawn between the words "news" and "had", consisting of a horizontal line connecting the two words, with a vertical line extending downwards from "news" and another vertical line extending downwards from "had", meeting at the bottom.

# Dependency Structure

# Dependency Structure

# Dependency Structure

# Dependency Structure

# Dependency Structure

# Dependency Structure

# Dependency Structure

# Terminology

<b>Superior</b>	<b>Inferior</b>
Head	Dependent
Governor	Modifier
Regent	Subordinate
⋮	⋮

# Comparison

- ▶ Dependency structures explicitly represent
  - ▶ Head-dependent relations (**directed arcs**)
  - ▶ Functional categories (**arc labels**)
  - ▶ Possibly some structural categories (parts-of-speech)
- ▶ Phrase structures explicitly represent
  - ▶ Phrases (**nonterminal nodes**)
  - ▶ Structural categories (**nonterminal labels**)
  - ▶ Possibly some functional categories (grammatical functions)
- ▶ Hybrid representations may combine all elements

## Some Theoretical Frameworks

- ▶ Word Grammar (WG) [Hudson(1984), Hudson(1990)]
- ▶ Functional Generative Description (FGD)  
[Sgall et al.(1986)Sgall, Hajičová and Panevová]
- ▶ Dependency Unification Grammar (DUG)  
[Hellwig(1986), Hellwig(2003)]
- ▶ Meaning-Text Theory (MTT) [Mel'čuk(1988)]
- ▶ (Weighted) Constraint Dependency Grammar ([W]CDG)  
[Maruyama(1990), Harper and Helzerman(1995),  
Menzel and Schröder(1998), Schröder(2002)]
- ▶ Functional Dependency Grammar (FDG)  
[Tapanainen and Järvinen(1997), Järvinen and Tapanainen(1998)]
- ▶ Topological/Extensible Dependency Grammar ([T/X]DG)  
[Duchier and Debusmann(2001),  
Debusmann et al.(2004)Debusmann, Duchier and Kruijff]

# Dependency Graphs

- ▶ A dependency structure can be defined as a directed graph  $G$ , consisting of
  - ▶ A set  $V$  of nodes,
  - ▶ A set  $E$  of arcs (edges),
  - ▶ A linear precedence order  $<$  on  $V$ .
- ▶ Labeled graphs:
  - ▶ Nodes in  $V$  are labeled with word forms (and annotation).
  - ▶ Arcs in  $E$  are labeled with dependency types.
- ▶ Notational conventions ( $i, j \in V$ ):
  - ▶  $i \rightarrow j \equiv (i, j) \in E$
  - ▶  $i \rightarrow^* j \equiv i = j \vee \exists k : i \rightarrow k, k \rightarrow^* j$

# Formal Conditions on Dependency Graphs

- ▶  $G$  is (weakly) **connected**:
  - ▶ For every node  $i$  there is a node  $j$  such that  $i \rightarrow j$  or  $j \rightarrow i$ .
- ▶  $G$  is **acyclic**:
  - ▶ If  $i \rightarrow j$  then not  $j \rightarrow^* i$ .
- ▶  $G$  obeys the **single-head** constraint:
  - ▶ If  $i \rightarrow j$ , then not  $k \rightarrow j$ , for any  $k \neq i$ .
- ▶  $G$  is **projective**:
  - ▶ If  $i \rightarrow j$  then  $i \rightarrow^* k$ , for any  $k$  such that  $i < k < j$  or  $j < k < i$ .

# Connectedness, Acyclicity and Single-Head

- ▶ Intuitions:
  - ▶ Syntactic structure is complete (**Connectedness**).
  - ▶ Syntactic structure is hierarchical (**Acyclicity**).
  - ▶ Every word has at most one syntactic head (**Single-Head**).
- ▶ Connectedness can be enforced by adding a special root node.

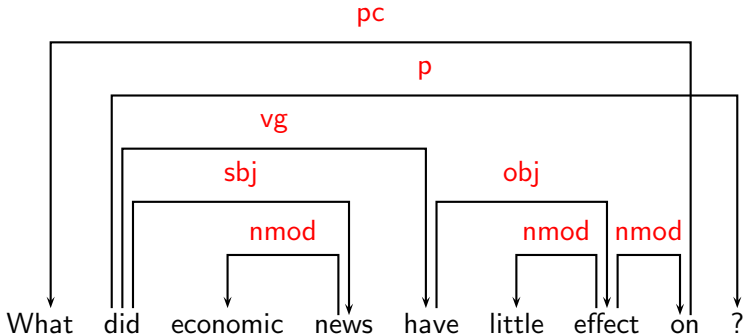

# Connectedness, Acyclicity and Single-Head

- ▶ Intuitions:
  - ▶ Syntactic structure is complete (**Connectedness**).
  - ▶ Syntactic structure is hierarchical (**Acyclicity**).
  - ▶ Every word has at most one syntactic head (**Single-Head**).
- ▶ Connectedness can be enforced by adding a special root node.

# Projectivity

- ▶ Most theoretical frameworks do **not** assume projectivity.
- ▶ Non-projective structures are needed to account for
  - ▶ long-distance dependencies,
  - ▶ free word order.

# Where we're going

- ▶ Dependency parsing:
  - ▶ Input: Sentence  $x = w_1, \dots, w_n$
  - ▶ Output: Dependency graph  $G$
- ▶ Focus:
  - ▶ Computational methods for dependency parsing
  - ▶ Resources for dependency parsing (parsers, treebanks)

# Parsing Methods

- ▶ Three main traditions:
  - ▶ Deterministic parsing (specifically: **Transition-based parsing**)
  - ▶ Dynamic programming (specifically: **Graph-based parsing**)
  - ▶ Constraint satisfaction (not covered today)
- ▶ Special issue:
  - ▶ Non-projective dependency parsing

# Deterministic Parsing

- ▶ Basic idea:
  - ▶ Derive a single syntactic representation (dependency graph) through a deterministic sequence of elementary parsing actions
  - ▶ Sometimes combined with backtracking or repair
- ▶ Motivation:
  - ▶ Psycholinguistic modeling
  - ▶ Efficiency
  - ▶ Simplicity

## Covington's Incremental Algorithm

- ▶ Deterministic incremental parsing in  $O(n^2)$  time by trying to link each new word to each preceding one [Covington(2001)]:

```

PARSE( $x = (w_1, \dots, w_n)$ )
1  for  $i = 1$  up to  $n$ 
2    for  $j = i - 1$  down to  $1$ 
3      LINK( $w_i, w_j$ )
  
```

$$\text{LINK}(w_i, w_j) = \begin{cases} E \leftarrow E \cup (i, j) & \text{if } w_j \text{ is a dependent of } w_i \\ E \leftarrow E \cup (j, i) & \text{if } w_i \text{ is a dependent of } w_j \\ E \leftarrow E & \text{otherwise} \end{cases}$$

- ▶ Different conditions, such as **Single-Head** and **Projectivity**, can be incorporated into the LINK operation.

# Shift-Reduce Type Algorithms

## Transition-based parsing

- ▶ Data structures:
  - ▶ Stack  $[\dots, w_i]_S$  of partially processed tokens
  - ▶ Queue  $[w_j, \dots]_Q$  of remaining input tokens
- ▶ Parsing actions built from atomic actions:
  - ▶ Adding arcs ( $w_i \rightarrow w_j, w_i \leftarrow w_j$ )
  - ▶ Stack and queue operations
- ▶ Left-to-right parsing in  $O(n)$  time
- ▶ Restricted to **projective** dependency graphs

# Yamada's Algorithm

- ▶ Three parsing actions:

$$\text{Shift} \quad \frac{[\dots]_S \quad [w_i, \dots]_Q}{[\dots, w_i]_S \quad [\dots]_Q}$$

$$\text{Left} \quad \frac{[\dots, w_i, w_j]_S \quad [\dots]_Q}{[\dots, w_i]_S \quad [\dots]_Q} \quad w_i \rightarrow w_j$$

$$\text{Right} \quad \frac{[\dots, w_i, w_j]_S \quad [\dots]_Q}{[\dots, w_j]_S \quad [\dots]_Q} \quad w_i \leftarrow w_j$$

- ▶ Algorithm variants:
  - ▶ Originally developed for Japanese (strictly head-final) with only the **Shift** and **Right** actions [Kudo and Matsumoto(2002)]
  - ▶ Adapted for English (with mixed headedness) by adding the **Left** action [Yamada and Matsumoto(2003)]
  - ▶ Multiple passes over the input give time complexity  $O(n^2)$

# Nivre's Algorithm

- ▶ Four parsing actions:

$$\text{Shift} \quad \frac{[\dots]_S \quad [w_i, \dots]_Q}{[\dots, w_i]_S \quad [\dots]_Q}$$

$$\text{Reduce} \quad \frac{[\dots, w_i]_S \quad [\dots]_Q \quad \exists w_k : w_k \rightarrow w_i}{[\dots]_S \quad [\dots]_Q}$$

$$\text{Left-Arc}_r \quad \frac{[\dots, w_i]_S \quad [w_j, \dots]_Q \quad \neg \exists w_k : w_k \rightarrow w_i}{[\dots]_S \quad [w_j, \dots]_Q \quad w_i \xleftarrow{r} w_j}$$

$$\text{Right-Arc}_r \quad \frac{[\dots, w_i]_S \quad [w_j, \dots]_Q \quad \neg \exists w_k : w_k \rightarrow w_j}{[\dots, w_i, w_j]_S \quad [\dots]_Q \quad w_i \xrightarrow{r} w_j}$$

- ▶ Characteristics:

- ▶ Integrated labeled dependency parsing
- ▶ Arc-eager processing of right-dependents
- ▶ Single pass over the input gives time complexity  $O(n)$

# Classifier-Based Parsing

- ▶ Data-driven deterministic parsing:
  - ▶ Deterministic parsing requires an **oracle**.
  - ▶ An oracle can be approximated by a **classifier**.
  - ▶ A classifier can be trained using **treebank** data.
- ▶ Learning methods:
  - ▶ Support vector machines (SVM)  
[Kudo and Matsumoto(2002), Yamada and Matsumoto(2003), Isozaki et al.(2004)Isozaki, Kazawa and Hirao, Cheng et al.(2004)Cheng, Asahara and Matsumoto, Nivre et al.(2006)Nivre, Hall, Nilsson, Eryiğit and Marinov]
  - ▶ Memory-based learning (MBL)  
[Nivre et al.(2004)Nivre, Hall and Nilsson, Nivre and Scholz(2004)]
  - ▶ Maximum entropy modeling (MaxEnt)  
[Cheng et al.(2005)Cheng, Asahara and Matsumoto]

# Feature Models

- ▶ Learning problem:
  - ▶ Approximate a function from **parser states**, represented by feature vectors to **parser actions**, given a training set of gold standard derivations.
- ▶ Typical features:
  - ▶ Tokens:
    - ▶ Target tokens
    - ▶ Linear context (neighbors in  $S$  and  $Q$ )
    - ▶ Structural context (parents, children, siblings in  $G$ )
  - ▶ Attributes:
    - ▶ Word form (and lemma)
    - ▶ Part-of-speech (and morpho-syntactic features)
    - ▶ Dependency type (if labeled)
    - ▶ Distance (between target tokens)

# Comparing Algorithms

- ▶ Parsing algorithm:
  - ▶ Nivre's algorithm gives higher accuracy than Yamada's algorithm for parsing the Chinese CKIP treebank [Cheng et al.(2004)Cheng, Asahara and Matsumoto].
- ▶ Learning algorithm:
  - ▶ SVM gives higher accuracy than MaxEnt for parsing the Chinese CKIP treebank [Cheng et al.(2004)Cheng, Asahara and Matsumoto].
  - ▶ SVM gives higher accuracy than MBL with lexicalized feature models for three languages [Hall et al.(2006)Hall, Nivre and Nilsson]:
    - ▶ Chinese (Penn)
    - ▶ English (Penn)
    - ▶ Swedish (Talbanken)

# Graph-Based Parsing

From here, we'll look at some slides from NASSLLI 2010 ...
